

## **100% Reduction in catheter migration during dressing changes<sup>2,6</sup>**

360 degree site cleaning while secured

## **100% Reduction in catheter pistoning**

Helps keep bacteria out of the insertion site

## **Dramatic reduction in catheter dislodgements<sup>3-8</sup>**

One of the biggest drawbacks of adhesive PICC securement devices is the fact they must be changed out with every dressing change.

While attempting to change out the adhesive device, the PICC is left unsecured. Line stability is a critical factor during any dressing change. It is extremely difficult to keep the PICC from moving during an adhesive securement device dressing change.

Just how often is PICC migration and dislodgement occurring with adhesive devices? Recent data<sup>1-2</sup> shows PICC migration and dislodgement rates of 14-20% for adhesive securement devices.

PICC movement (migration, dislodgement, pistoning) can lead to clinical complications like infection, thrombosis, phlebitis and vessel damage.

The costs of these complications are significant:

- Catheter replacement
- Repeat CXR
- Labor cost
- tPA use
- Antibiotic therapy
- Increased length of stay

A key benefit of the SecurAcath is its ability to keep the PICC where you placed it. The SecurAcath secures the PICC right where it enters the skin and prevents movement of the catheter for the duration of therapy. This is especially helpful during dressing changes because the PICC is always secured.

The new data above continues to support the very low catheter migration and dislodgement rates from previous studies which show 0 – 1.5% rate for the SecurAcath.<sup>3-8</sup>

SecurAcath provides improved catheter securement, which reduces complications and total cost of patient care.

- Dramatically reduces catheter dislodgement
- Decreased catheter movement and migration
- Improved efficiency
- 360 degree site cleaning while secured

**When you need to hold the line – You need SecurAcath**
